LAB N°07

1- Install a VMs (1Gb of RAM), one as a SAMBA **server**.

2- Install on the server the samba server packages.

3- Create two directories (**/samba_read** and **/samba_write**) and configure the share of them on smb.conf file. Where /samba_read is in read only and /samba_write in read write mode.

4- Use the host machine as a client.

5- Use the cmd command **net use** to mount the two shared directories on the samba server.

6- Test the share with file browser.

7- Delete the share with cmd command net use.
